

同次形  $\frac{dy}{dx} = f\left(\frac{y}{x}\right) \implies \frac{y}{x} = u$  とおく

例 6 次の微分方程式の一般解を求めよ。

(1)  $y^2 + (x^2 - xy)\frac{dy}{dx} = 0$

(2)  $y + \sqrt{x^2 + y^2} = x\frac{dy}{dx}$

(解)

(1)  $x \neq 0$  のとき、両辺を  $x^2$  で割ると

$$\left(\frac{y}{x}\right)^2 + \left(1 - \frac{y}{x}\right)\frac{dy}{dx} = 0$$

$$\frac{y}{x} = u \text{ とおくと、}$$

$$u^2 + (1 - u)\frac{dy}{dx} = 0 \quad \dots \text{ ①}$$

$$y = xu \text{ より } \frac{dy}{dx} = u + x\frac{du}{dx} \quad \dots \text{ ②}$$

②を①に代入して

$$u^2 + (1 - u)\left(u + x\frac{du}{dx}\right) = 0$$

$$x(u - 1)\frac{du}{dx} = u$$

$$\frac{u - 1}{u}du = \frac{1}{x}dx$$

$$\int \left(1 - \frac{1}{u}\right)du = \int \frac{1}{x}dx$$

$$u - \log|u| = \log|x| + c$$

$$u = \log|u| + \log|x| + c$$

$$u = \log|xu| + c$$

これと  $\frac{y}{x} = u$  より

$$\frac{y}{x} = \log|y| + c$$

$$\log|y| = \frac{y}{x} - c$$

$$|y| = e^{\frac{y}{x} - c}$$

$$y = \pm e^{-c}e^{\frac{y}{x}}$$

$$\pm e^{-c} = C \text{ とおくと}$$

$$y = Ce^{\frac{y}{x}} \quad (C \text{ は任意定数}) \quad ,,$$

(2)  $x \neq 0$  のとき、両辺を  $x$  で割ると

$$\frac{dy}{dx} = \frac{y}{x} + \sqrt{1 + \left(\frac{y}{x}\right)^2}$$

$$\frac{y}{x} = u \text{ とおくと、} \frac{dy}{dx} = u + \sqrt{1 + u^2} \dots \text{ ①}$$

$$y = xu \text{ より } \frac{dy}{dx} = u + x\frac{du}{dx}$$

$$x\frac{du}{dx} = \sqrt{1 + u^2}$$

$$\int \frac{1}{\sqrt{1 + u^2}}du = \int \frac{1}{x}dx$$

$$\log|u + \sqrt{1 + u^2}| = \log|x| + c$$

$$\log\left|\frac{u + \sqrt{1 + u^2}}{x}\right| = c$$

$$\frac{u + \sqrt{1 + u^2}}{x} = \pm e^c$$

$\pm e^c = c_1$  とおくと

$$u + \sqrt{1 + u^2} = c_1x \quad \dots \text{ ②}$$

$$\frac{y}{x} = u \text{ より、} \frac{y}{x} = \sqrt{1 + \frac{y^2}{x^2}} = c_1x$$

$$y + \sqrt{x^2 + y^2} = c_1x^2 \quad \dots \text{ ③}$$

$$\text{①, ②から } \frac{dy}{dx} = c_1x$$

$$y = \int c_1x dx = \frac{1}{2}c_1x^2 + c_2$$

$$c_1x^2 = 2y - 2c_2 \quad \text{これを ③に代入して}$$

$$y = \sqrt{x^2 + y^2} = 2(y - c_2)$$

$$-2c_2 = C \text{ とおくと } \sqrt{x^2 + y^2} = y + C$$

$$x^2 + y^2 = (y + C)^2 \quad (C \text{ は任意定数}) \quad ,,$$
